To the reader

This codebook is part of the data FSD2919 archived at the FSD (Finnish Social Science Data Archive). The dataset has been described in as much detail as possible in Finnish and English. Variable frequencies, variable and value labels, and missing values have been checked. If necessary, the data have been anonymised. The data and its creators shall be cited in all publications and presentations for which the data have been used. The bibliographic citation may be in the form suggested by the archive or in the form required by the publication. The bibliographic citation suggested by the archive:

The user shall notify the archive of all publications where she or he has used the data. The original data creators and the archive bear no responsibility for any results or interpretations arising from the reuse of the data.

The codebook contains information on data content, structure and data collection, and includes a list of publications wholly or in part based on the data, according to publication information received by the FSD. The second part of the codebook contains information on variables: question texts, response options, and frequencies. The third part contains indexes.

Variable distributions presented in this codebook have been generated from the SPSS files. Distribution tables present variable values, frequencies (n), frequency percentages (%), and valid percentages (v. %) which take into account missing data. All distributions are unweighted. If the data contain weight variables, these will be found at the end of the variables list. In some cases frequency distributions have been substituted by descriptive statistics. Categorised responses to open-ended questions are not always included in the codebook. Distributions may contain missing data. The note "System missing (SYSMIS)" refers to missing observations (e.g. a respondent has not answered all questions) whereas "Missing (User missing)" refers to data the user has defined as missing. For example, the user may decide to code answer alternatives 'don't want to say' or 'can't say' as missing data.

The codebook may contain attached files, the most common one being the questionnaire.

Finnish Youth Surveys

Advisory Council for Youth Affairs (Nuora), nowadays called the State Youth Council, started to produce Youth Surveys in 1994. This survey series charts attitudes and expectations of Finnish young people aged 15 - 29. Each survey contains both current questions and recurring questions which are repeated over time, enabling the study of long-term attitude changes. The main themes include attitudes to education, working life, social security, spending, drug use, and young people's willingness to participate in order to influence decision-making.

Abstract

The theme of the Finnish Youth Survey 2013 was participation, which was studied by investigating young people's voting behaviour, reasons for participation, belonging in communities and views on the possibilities of influencing decision-making.

First, the respondents' views on the importance of different principles, values and aspects of life (e.g. own health, leisure time, national security, human rights) were charted. Relating to civic engagement, the respondents were asked whether they had been involved in political activity in the previous 12 months, whether they had tried to influence issues important to them in the previous 12 months, which reasons had motivated them to act for a cause and which had dissuaded them from acting. Opinions were charted on the various ways of influencing decision-making and policies, whether the respondents themselves had used these ways to influence, whether they had voted in the previous municipal elections and if they had not, the importance of different reasons for not voting. The respondents were also asked how important certain reasons for not voting were to young people in general and what they thought their chances of influencing different things were (e.g. own economic well-being, EU decision-making).

The extent to which the respondents agreed with various statements relating to career and employment was investigated as well as opinions on how much responsibility different bodies and actors should hold for the well-being of Finns. Views on politics, voting and decision-making were studied by charting how much the respondents agreed with a number of statements. Finally, the respondents were asked to what extent they identified with different regions and areas,

whether they used social media and how they used it, and whether they participated in the activities of a group or community in their leisure time.

Background variables included, among others, the respondent's gender, age, mother tongue, household composition, country of birth, nationality, identification with a minority group, education level, average grade of the latest report card, economic activity and occupational status, mother's education level and countries of birth of parents.

1.3 Structure and collection of the data

Country: Finland

Geographic coverage: Finland

Analysis or observation unit type: Individual

Universe: Young people aged 15-29 living in Finland, excluding the Åland Islands

Collection date: 17.5.2013 – 14.7.2013

Data collector(s): TNS Gallup Finland

Mode of data collection: Telephone interview

Type of research instrument: Structured questionnaire

Time period covered: 2013

Time method of the data collection: Longitudinal: Trend/Repeated cross-section

Response rate: 26%

Number of variables and cases: The data contain 216 variables and 1903 cases.

Sampling procedure: Probability: Stratified

A random sample drawn from the population register. The sample size was 22,215 people, out of whom 625 were Swedish-speaking. 7,382 people were contacted, out of whom 5,430 refused to participate and 45 were unable to respond. Additionally, 4 interviews were interrupted as a result of a system interference. 1,802 Finnish-speaking and 100 Swedish-speaking young persons were successfully interviewed. The response rate has been calculated based on the number of successful interviews and the number of people contacted.

1.4 Use of data

Data appraisal

Variable T3 (the respondent's postal code) was removed from the data during the archiving process. The variable containing information on the respondents' municipalities of residence was coarsened into the statistical grouping of municipalities.

Weighting

The data contain two weight variables, W1 and W2, which were created using a calibration method in order to improve estimation efficiency and to correct non-response bias. The weights are based on the following population distributions: 1) gender, 2) age, 3) major region (NUTS 2) and 4) language. The variable W2 weights the results to match the whole Finnish population (the sum of the weights equals the size of the Finnish population). The variable W1 does not produce this kind of extension (the weighted mean is 1 and the sum equals the number of cases [1,903]). Both variables are based on the same calibration process, only the scale is different.

Restrictions

The dataset is (B) available for research, teaching and study.
