# To the reader

This codebook is part of the data FSD3396 archived at the FSD (Finnish Social Science Data Archive). The dataset has been described in as much detail as possible in Finnish and English. Variable frequencies, variable and value labels, and missing values have been checked. If necessary, the data have been anonymised. The data and its creators shall be cited in all publications and presentations for which the data have been used. The bibliographic citation may be in the form suggested by the archive or in the form required by the publication. The bibliographic citation suggested by the archive:

The user shall notify the archive of all publications where she or he has used the data. The original data creators and the archive bear no responsibility for any results or interpretations arising from the reuse of the data.

The codebook contains information on data content, structure and data collection, and includes a list of publications wholly or in part based on the data, according to publication information received by the FSD. The second part of the codebook contains information on variables: question texts, response options, and frequencies. The third part contains indexes.

Variable distributions presented in this codebook have been generated from the SPSS files. Distribution tables present variable values, frequencies (n), frequency percentages (%), and valid percentages (v. %) which take into account missing data. All distributions are unweighted. If the data contain weight variables, these will be found at the end of the variables list. In some cases frequency distributions have been substituted by descriptive statistics. Categorised responses to open-ended questions are not always included in the codebook. Distributions may contain missing data. The note "System missing (SYSMIS)" refers to missing observations (e.g. a respondent has not answered all questions) whereas "Missing (User missing)" refers to data the user has defined as missing. For example, the user may decide to code answer alternatives 'don't want to say' or 'can't say' as missing data.

The codebook may contain attached files, the most common one being the questionnaire.

### **Series description**

The data belong to the series:

Family Barometers

The Family barometers series was launched by the Population Research Institute, a subdivision of the Finnish Family Federation, in 1996. The annual surveys revolve round family life, but each barometer has also its own theme. These have included assistance between different generations, sufficiency of public support and services, the division of domestic responsibilities, work-life balance, parenting, child-rearing, and children's pastimes and hobbies.

### **Abstract**

The study charted Finnish views on ideals and plans about having children. Main themes included starting a family, the ideal size of a family, pregnancy, obstacles faced in having children, personal partnership and desire to have a baby. The study was funded by the Family Federation of Finland, Alli Paasikivi Foundation and Suomen kotien kukkasrahasto foundation.

The first set of questions focused on the personal partnerships of the participants, investigating, for example, satisfaction with the relationship and expectations for the relationship in the future. The respondents' childhood homes were studied with questions on, for example, happiness, conflicts, financial problems and support received from parents.

Some questions focused on children, charting, for example, the housing arrangements of the children and whether the respondent and their spouse had children from previous relationships. Pregnancy was examined through questions relating to the most important reasons behind the decision to have a child, specifically the respondent's youngest child, (e.g. the desire to have a sibling for older children or a strong desire to have a baby) as well as any challenges and concerns faced when the child was born (e.g. financial circumstances, health of the parents or the baby). Ideal family size and the appropriate age to become a parent or have the last child were surveyed.

Next, the respondents were asked questions relating to pregnancy. Questions examined, for example, willingness and hope for pregnancy (either the respondent or their spouse) in the near future, reasons for not having a child and the perceived impacts having a baby would have on the respondents' lives (e.g. financial problems, less opportunities for work, positive impact on relationships and social life). Values and attitudes were also charted with questions focusing on, for example, the importance of work, family and hobbies in the respondents' lives and the feelings they had when interacting with babies and children (e.g. whether they wanted to have a child after holding a baby or wanted to get as far away as possible when hearing a baby cry). Statements relating to not wanting to have children after interacting with someone else's child

or seeing them cry or have a tantrum were presented to both those who had and did not have children.

Health-related questions investigated satisfaction with life, smoking, alcohol use, birth control methods and mental health. Finally, the respondents who were women were asked about their pregnancies and experiences related to pregnancies. The time spent trying to get pregnant, the number of times the respondent had been pregnant, possible fertility treatments and miscarriages were charted.

Background variables included, among others, the respondent's gender, year of birth, number of children, marital status, household composition, perceived social class, level of education and annual personal and household income. Information was also collected on the spouse's gender, year of birth, level of education and occupational status.

### 1.3 Structure and collection of the data

**Country:** Finland

**Geographic coverage:** Finland

**Analysis or observation unit type:** Individual, Family

**Universe:** Persons aged 20-55 living in Finland who have at most three children, excluding the Åland Islands

**Collection date:** 1.2.2015 – 28.2.2015

**Data collector(s):** TNS Gallup Finland

**Mode of data collection:** Self-administered questionnaire: Web-based (CAWI)

**Type of research instrument:** Structured questionnaire

**Time period covered:** 2015

**Time method of the data collection:** Cross-section

**Number of variables and cases:** The data contain 262 variables and 3180 cases.

**Sampling procedure:** Non-probability

TNS Gallup Finland chose the respondents from their population panel that represents the population of Finland (excluding the Åland Islands) based on the demographic of Finland. Data collection ended when the wanted amount of respondents was reached. Data collection was conducted with an online survey for the first time in the data series, contrary to earlier surveys which were conducted as postal surveys.

### 1.4 Use of data

#### Data appraisal

The filters used in the survey are visible in variable labels in the data.

To prevent identification of individuals, the response option for Sami language was merged with
